FOREWORD

INTRODUCTION

4-HYDROXYBENZOIC ACID

CAS N°: 99-96-7

SIDS Initial Assessment Report for 9th SIAM

(France, June 29-July 1, 1999)

Chemical Name:	4-Hydroxybenzoic acid
~ . ~	0005

CAS No: 99-96-7 Sponsor Country: Japan

National SIDS Contact Point in Sponsor Country:

Mr. Kazuhide Ishikawa

Ministry of Foreign Affairs, Japan

HISTORY:

SIDS Testing Plan were reviewed in SIDS Review Process, where the following SIDS Testing Plan was agreed:

no testing ()

testing (X) Water solubility, Vapour pressure, Octanol/water partition

coefficient, Stability in water, Biodegradation

Chronic toxicity to daphnia

Combined repeat dose and reproductive toxicity,

Gene mutation, Chromosomal aberration test in vitro

Deadline for circulation: March 31, 1999 Date of Circulation: March 30, 1999

(To all National SIDS Contact Points and the OECD Secretariat)

SIDS INITIAL ASSESSMENT PROFILE

CAS NO.	99-96-7
CHEMICAL NAME	4-Hydroxybenzoic acid
Structural formula	носоон

RECOMMENDATIONS OF THE SPONSOR COUNTRY

The chemical is currently of low priority for further work.

SHORT SUMMARY WHICH SUPPORTS THE REASONS FOR THE RECOMMENDATIONS

4-Hydroxybenzoic acid is readily biodegradable (OECD 301C: 100 % after 28-day), and low bioaccumulative based on Log P_{ow} value (1.37 at 25 °C).

Toxicity of this chemical seems to be relatively low to aquatic organisms because all toxicity data to test organisms belonging to three trophic levels were higher than 32 mg/l. For the algal test (*Selenastrum capricornutum*), 72-h EC₅₀, 72-h NOEC and 96-h EC₅₀ are 68.5 mg/l, 32.0 mg/l and 42.8 mg/l, respectively. For testing in daphnids, *Daphnia magna*, both 48-h EC₅₀ for immobilisation and 21-day EC₅₀ for reproduction were more than 100 mg/l. LC₅₀s of *Oryzias latipes* were >100 mg/l (48 hours), 92.8 mg/l (72 hours) and 92.8 mg/l (72 hours), 14-day LC₅₀ was 66.5 mg/l. No data are available for effects on terrestrial organisms.

Oral LD₅₀ of 4-hydroxy benzoic acid for rats is more than 2,000 mg/kg. This chemical is considered to be slightly irritating to skin and moderate to eyes, and a mild skin sensitizer. In an OECD combined repeat dose and reproductive/developmental toxicity study in rats at 40, 200 and 1,000 mg/kg/day, this chemical induced rale and rhinorrhea, indicative of imitation to respiratory tract irritation, and small fluctuation of blood chemistry with no changes of histopathological findings and organ weights. These changes of blood chemistry are considered not to be adverse. Therefore, no sign of toxic effects in repeated dose toxcity testing were detected at the highest dose of 1,000 mg/kg/day. Reproductive toxicity was not observed up to the highest test dose of 1000 mg/kg/day, suggesting no reason for concern. This chemical is not genotoxic, based on negative results of bacterial mutation test and chromosomal aberration test *in vitro*. In vaginal cornification and uterotrophic assay of mice, this chemical showed estrogenic response.

It is produced ca. 10,000 tons/year by one company in Japan, and 142 tons (ca. 1.4 %) is wasted through a waste-water treatment plant with a removal rate of 97 % together with 4.4×10^9 L/year effluent into sea. This chemical is used as intermediate for pesticide, antiseptics and pharmaceuticals. No consumer use is reported.

A generic fugacity model (Mackey level III) shows that most (99.5%) of this chemical will be distributed in water phase after discharged into water.

IF FURTHER WORK IS RECOMMENDED, SUMMARISE ITS NATURE

FULL SIDS SUMMARY

SIDS INITIAL ASSESSMENT REPORT

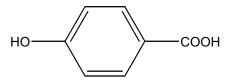

1. IDENTITY

• OECD Name: 4-Hydroxybenzoic acid

• Synonym: 4-Hydroxybenzenecarboxylic acid

CAS Number: 99-96-7
 Empirical Formula: C₇H₆O₃

Structural Formula:

Degree of Purity: 99.7%
 Major Impurity: None
 Essential Additives: None
 Physical-chemical properties

Melting Point: 216.2 °C

Vapour pressure: 3.9×10^{-3} Pa at $100 \,^{\circ}$ C

Water solubility: 6,000 mg/L

Log Pow: 1.37

2. GENERAL INFORMATION ON EXPOSURE

2.1 Production and import

The production volume of 4-hydroxybenzoic acid in Japan is 10,000 tonnes/year in 1995.

2.2 Use pattern

All of 4-hydroxybenzoic acid produced in Japan are used as a monomer unit of polymer and as an intermediate of pesticide and antiseptics, and no consumer use is reported.

2.3 Other information

None

3. ENVIRONMENT

3.1 Environmental Exposure

3.1.1 General Discussion

4-Hydroxybenzoic acid is readily biodegradable (OECD 301C: 100 % after 28d). Although direct photodegradation is expected because 4-hydroxybenzoic acid has absorption band in UV and VIS region, the data of half-lifetime is not available.

4-Hydroxybenzoic acid is low bioaccumulative based on Log Pow (1.37 at 25 °C).

The potential environmental distributions of 4-hydroxybenzoic acid obtained from a generic Mackay level III fugacity model is shown in Table 1. Parameters used for this model are shown as Annex to this report. The results show that, if 4-hydroxybenzoic acid is released into water, it is unlikely to be distributed into other compartments. If 4-hydroxybenzoic acid is released into air or soil, it is likely to be distributed in other compartments.

Table 1
Environmental distribution of 4-hydroxybenzoic acid
Using a generic level III fugacity model.

Compartment	Release	Release	Release
	100% to air	100% to water	100% to soil
Air	0.0 %	0.0 %	0.0 %
Water	28.5 %	99.5 %	23.3 %
Soil	71.4 %	0.0 %	76.6 %
Sediment	0.1 %	0.5 %	0.1 %

As this chemical is used in closed system as a monomer unit of polymer or an intermediate of pesticide, and is not included in consumer products, its release to the environment may occur only from the production site.

3.1.2 Predicted Environmental Concentration

As 4-hydroxybenzoic acid is produced under the well-controlled closed system, amount of release to air phase is negligibly small. The waste of 4-hydroxybenzoic acid from the production system is released to water phase after treated its own wastewater treatment plant. Therefore, Predicted Environmental Concentration (PEC) will be calculated only for the water environment.

a. Regional exposure

According to report from a Japanese manufacturer, 142 tonnes/year (measured) of 4-hydroxybenzoic acid are treated in its own wastewater treatment plant with 97% of removal rate (Plant 1:80%, Plant 2:85%) and released with 4.4 x 10^9 L/year of effluent into sea. Local Predicted Environmental Concentration (PEC_{local}) is calculated to be 9.7 x 10^{-4} mg/L as a worst case scenario, employing the following calculation model and dilution factor of 1000 (default).

A. Effects on the Environments

3.2.1 Effects on aquatic organisms

Acute and chronic toxicity data of 4-hydroxybenzoic acid to test organisms are summarized below (Table 2). Toxicity of this chemical to aquatic organisms seems relatively low, because NOEC values of *Selenastrum* and *Oryzias latipes* are 32.0 mg/l and 66.5 mg/l, respectively. PNEC of this chemical was determined mainly based on the toxicity data obtained by the Environment Agency of Japan through a GLP-laboratory. Concentrations of the chemical were

kept at the levels of 84 to 105 % of the nominal concentrations in all toxicity tests. Several data by different organizations were available in the AQUIRE and IUCLID. As the lowest acute and chronic toxicity data, 14d LC_{50} of fish and NOEC of algae were adopted, respectively (Table 2).

The assessment factors of 100 were used to both acute and chronic toxicity data to determine PNEC, according to the OECD Provisional Guidance for Initial Assessment of Aquatic Effects (EXCH/MANUAL/96-4-5.DOC/May 1996), because chronic toxicity data for fish was absent.

From acute toxicity data (14d LC₅₀ of fish):

PNEC = 66.5/100 = 0.665 mg/l

From chronic toxicity data (72h NOEC of algae): PNEC = 32.0/100 = 0.32 mg/l

Thus, PNEC of 4-hydroxybenzoic acid is 0.32 mg/l.

Table 2
Acute and chronic toxicity data of 4-hydroxybenzoic acid to aquatic organisms at different trophic levels. The data were obtained by the Environmental Agency of Japan based on the OECD Test Guide Lines and GLP.

Species	Endpoint	Conc. (mg/l)	Remarks
Selenastrum capricornutum (algae)	Bms 72 h EC50	68.5	A, 1)
	Bms 72 h NOEC	32.0	C, 1), C
Chlorella pyrenoidosa (algae)	Bms 96 h EC50	42.8	a, 2), A
Daphnia magna (Water flea)	Imm 48 h EC50	135.7	a, 1), A
	Rep 21 d EC50	> 100	c, 1)
	Rep 21 d NOEC	> 100	c, 1), C
Daphnia magna	Imm 48 h EC50	173.0	a, 3)
Oryzias latipes (fish, Medaka)	Mor 48h LC50	> 100	a, 1)
	Mor 72h LC50	92.8	a, 1)
	Mor 96h LC50	92.8	a, 1)
	Mor 14d LC50	66.5	a, 1), A
Oncorhynchus mykiss (Rainbow trout)	Mor 96h LC50	> 99.4	a, 4)

Notes: Bms; biomass, Mor; mortality, Rep; reproduction

A), C); the lowest values among the acute or chronic toxicity data of algae, cladocera (water flea) and fishes to determine PNEC of 4-hydroxybenzoic acid.

References in Table 2: (1) Toxicity tests were conducted by the Environment Agency of Japan based on OECD Test GuideLines and GLP; (2) Larson, L.J. (1991); (3) Kuhn, R., Pattard, M., Pernak, K., and Winter, A. (1989); (4) Hodson, P.V., and Kaiser, K.L. (1984)

3.2.2 Terrestrial effects

No data available

3.2.3 Other effects

No data available

3.3 Initial Assessment for the Environment

Predicted No Effect Concentration (PNEC) of this chemical has been calculated as 0.32 mg/l.

PEC from Japanese local exposure scenario is 9.7 x 10⁻⁴ mg/l.

Thus,
$$PEC_{local} / PNEC = 9.7 \times 10^{-4} / 0.32 = 0.003$$

Therefore, it is currently considered of low potential risk for environments and low priority for further work.

4. HUMAN HEALTH

4.1 Human Exposure

4.1.1 Occupational exposure

4-Hydroxybenzoic acid is produced in closed systems and used as an intermediate for agricultural chemical synthesis and antiseptics. The occupational exposures are expected through inhalation and the dermal route is assumed negligible because this chemical is solid. As the atmospheric concentration in plant was not measured, the maximum exposure levels are estimated according to working schedules as follows. If a single worker (body weight; 70 kg, respiratory volume; 1.25 m³/hr) is assigned to implement these two bag filling operations without protection, the highest daily intake (combined EHE) is calculated as 0.067 mg/kg/day as the worst cases. Practically, workers always wear protective gloves and respiratory protective equipment (mask) during the operation.

	Frequency Times/day	Duration hr	Working hr/day	Concentration mg/m ³	EHE mg/kg/day	Combined EHE mg/kg/day
Bag Filling	0.44	2	0.88	2.99	0.04700	
Bag Filling	0.058	6.6	0.38	2.99	0.02000	0.067

EHE: Estimated Human Exposure

4.1.2 Consumer exposure

As all of 4-hydroxybenzoic acid produced in Japan are used as a monomer unit of polymer and as an intermediate of pesticide, and no consumer use is reported in Sponsor country, consumer exposure is not expected.

4.1.3 Indirect exposure via the environment

Although 4-hydroxybenzoic acid is readily biodegradable and low bioaccumulative, the exposure to the general population via the environment would be possible through drinking water processed from surface water and through fish which may accumulate this chemical.

The concentration in drinking water should be estimated to be equal to PEC calculated in Section 3.1, i.e. 9.7×10^{-4} mg/l. The daily intake through drinking water is calculated as 3.23×10^{-5} mg/kg/day (2 l/day, 60 kg b.w.).

Using the bioconcentration factor of 5.0 estimated from log Pow (1.37), the concentration of this chemical in fish can be calculated as follows:

$$PEC_{fish} = (9.70 \times 10^{-4} \text{ mg/l}) \times 5.0 = 4.85 \times 10^{-6} \text{ mg/g-wet}$$

As a daily intake of fish in Japan is estimated to be 90 g for 60 kg body weight person, a daily intake of this chemical will be 7.28 x 10⁻⁶ mg/kg/day.

4.2 Effects on Human Health

a) Acute toxicity

[SIDS data] The oral LD $_{50}$ value for 4-hydroxybenzoic acid was 6,000 mg/kg for rats (Ueno Pharm. Inc.).

In another oral study, the LD₅₀ value was 2,200 mg/kg for mice (Drug Standards: 1952).

The intraperitoneal LD₅₀ value was 340 and 210 mg/kg for rats (Gigiena i Sanitariya: 1986) and mice (J Am Pharm Assoc, Sci Ed: 1956), respectively. Muscle weakness was observed in rats and flaccid paralysis without anesthesia (usually neuromuscular blockage), somnolence (general depressed activity), and ataxia were observed in mice.

The subcutaneous LD₅₀ was 1,050 mg/kg for mice (Arch Intl Pharmacodyn Ther: 1960).

b) Irritation

4-Hydroxybenzoic acid was reported to be slightly irritating to skin and moderate to eyes in Bayer Report (1980a,b).

This chemical (500 mg) was applied to the clipped skin with occlusive dressing for 24 hours. Erythema and edema were observed but these changes were very weak. Erythema was reversible within 8 days but edema was not.

As for eye irritation, this chemical ($100 \mu g$) was applied to conjunctivae under the right eyelid. Corneal opacity, conjunctival redness, and chemosis were observed. These signs of irritation were not reversible within 8 days.

Based on these observations, this chemical is considered to be slightly irritating to skin and moderate to eyes.

c) Sensitisation

4-Hydroxybenzoic acid was reported as a mild sensitizer by guinea pig maximization test (Scholes *et al.*; 1992). In this test, 10 animals (4 animals in control group) were induced intradermally at 1.0 % and topically at 20 % six to eight days later. After 12-14 days, all animals were challenged by 20 %. The sensitization potential was 20 % (the percentage of animals exhibiting a reaction significantly greater than control animals).

On the other hand, the local lymph node assay in mice showed that this chemical was not a sensitizer (Scholes *et al.*; 1992). In this assay, 4 animals were inducted by daily topical application of 2.5 - 15.0 % for three consecutive days. Five days after the initiation of exposure, [3 H] methyl thymidine was injected and the labeling in lymph node cells was measured. The ratio of labeling incorporation by tested lymph node cells to that recorded for control lymph node cells, (T/C) ratio was 0.6 - 1.5 (more than 3.0 is positive).

d) Repeated toxicity

[SIDS data] Oral toxicity study was performed in SD (Crj: CD) rats by an OECD combined repeat dose and reproductive/developmental toxicity screening test. 4-Hydroxybenzoic acid was administered by gavage at doses of 40, 200 and 1,000 mg/kg for 45 days in males and from 14 days before mating to day 3 of lactation in females. (MHW, Japan: 1997)

All animals survived at all treated groups. 4-Hydroxybenzoic acid induced rale and temporary salivation (sometimes accompanied by rhinorrhea) at 1,000 mg/kg and slightly at 200 mg/kg. These changes were suggesting the irritation of this chemical to respiratory tract. There were no adverse effects on body weight change and food consumption. At necropsy, no histological and morphological changes were observed. In hematological and blood chemical findings of males, decrease in the percentage of lymphocytes and the blood glucose at 200 mg/kg or more groups and decrease in total protein and increase in A/G ratio, GPT and GOT at 1,000 mg/kg were observed. These changes were significant, but not considered adverse effects. Therefore, NOAEL for systemic toxicity was considered to be 1,000 mg/kg/day.

e) Reproductive/developmental toxicity

Reproductive toxicity

[SIDS data] Oral toxicity study was performed in SD (Crj: CD) rats by an OECD combined repeated dose and reproductive/developmental toxicity screening test. 4-Hydroxybenzoic acid was administered by gavage at doses of 40, 200 and 1,000 mg/kg for 45 days in males and from 14 days before mating to day 3 of lactation in females. (MHW, Japan: 1997)

4-Hydroxybenzoic acid showed no adverse effects on copulation, fertility, maintenance of pregnancy, parturition and lactation, as well as viability, sex ratio, body weights and morphological appearance of pups at all treated groups. The NOAEL of reproductive toxicity for parents and offsprings was considered to be 1,000 mg/kg/day.

Developmental toxicity

Single oral toxicity study (day 11 of gestation) was performed in Sprague-Dawley rats at doses of 333, 667, 1,000 mg/kg. 4-Hydroxybenzoic acid showed no maternal toxicity, including death and change in body weight gain at 24 and 72 hours after treatment. In addition, no developmental toxicity was observed, including change in litter size, pup weight, and total litter weight at 1 and 6 days after birth, and overt malformation. Therefore, NOAEL was considered to be 1,000 mg/kg. (Kavlock *et al.*: 1990)

Some other developmental toxicity studies by a single administration were performed. No teratogenic effect was observed after subcutaneous application to rats at day 9 of gestation or intramuscular application to mice at day 9 or 12 of gestation (Details were not clear, Larsson and Bostrom: 1965, Koshakji and Scheulert: 1973).

However, any above experiments does not fully support no developmental toxicity of 4-hydroxybenzoic acid, because the exposure conditions were not suitable as the developmental toxicity study.

There was a data on developmental toxicity of ethylparaben (102-47-8). This chemical was shown to hydrolyse to 4-hydroxybenzoic acid rapidly in liver and kidney tissue taken from dogs (Jones *et al.*: 1956) and almost completely after intravenous injection or injected directly into the small intestine in rats (Kiwada et al: 1979 & 1980). In this study, a diet containing 0.1, 1 or 10 % ethylparaben (around 60, 540 and 2800 mg/kg/day) was given to rats on days 8 – 15 of pregnancy. In the 10 % group, some fetuses showed low body weight, and there were some instances of malformations of bones and viscera. However, these changes were considered due to malnutrition of dams. Neonatal growth curves showed no abnormal trends. No signs of teratogenicity were observed in fetuses. (Moriyama *et al*: 1975)

f) Genetic toxicity

Bacterial test

[SIDS data] Gene reverse mutation was negative in *S. Typhimurium* TA100, TA98, TA1535, TA1537 and *E.coli* WP2 *uvr*A with and without metabolic activation (MHW, Japan: 1997).

Non-bacterial test in vitro

[SIDS data] Chromosomal aberration test was conducted at concentrations of 0, 0.18, 0.35, 0.70 mg/ml with and without metabolic activation in cultured Chinese hamster lung (CHL/IU) cells. 4-Hydroxybenzoic acid induced structural chromosomal aberrations at 0.70 mg/ml with short-term treatment with metabolic activation and with continuous treatment. Polyploidy was also induced at 0.70 mg/ml with 48 hr continuous treatment, and at 0.70 and 0.18 mg/ml with short-term treatment with metabolic activation. Since this chemical decreased pH in the medium, a confirmation test was conducted under pH-adjusted conditions. As a result, no chromosomal aberrations were observed. As the further study, micronucleus in those cells under the same exposure condition was analysed. Although sufficient increase in micronucleus (Type 2: typical micronucleus) was observed, occurrence was low (1.9 %) and other micronucleus was not observed. Therefore, it was suggested that chromosomal aberrations induced by this chemical were not caused by the direct effects on DNA. (MHW. Japan: 1997)

Based on these results, 4-hydroxybenzoic acid was considered not to be genotoxic.

g) Specific toxicity

It is reported that various phenyl and phenolic acids inhibit the incorporation of mevalonate into cholesterol by homogenates of rat liver and of rat brain. In order to find the specificity and mechanism of this inhibition, a study on various phenyl and phenolic acids was conducted with homogenate of rat liver. As a result, 4-hydroxybenzoic acid competed with the substrate mevalonate 5-pyrophosphate, and inhibited mevalonate pyrophosphate decarboxylase. And this chemical also inhibited mevalonate phosphate kinase. (Shama Bhat and Ramasarma: 1979) However, since no change in cholesterol level was observed in all toxicity studies, this result is considered not to be important for toxicity of this chemical.

Estrogenic effect of 4-hydroxybenzoic acid was examined in vaginal cornification and uterotrrophic assay (Lemini *et al.*: 1997). Immature intact and adult ovariectomized female mice (CD1) were treated subcutaneously daily for 3 days with vehicle (corn oil, 0.3 ml/100 g), E2 (1 μ g/100 g), and 4-hydroxybenzoic acid (0.5, 5, 50, and 500 μ g/100 g).

Four days after treatment, a dose-dependent response on vaginal cornification and uterotrophic activity was observed in both immature intact and adult ovariectomized mice treated with this chemical. The relative uterotrophic potency of this chemical (500 $\mu g/100$ g) to estradiol (1 μg m/100 g) was 0.0011 in immature and 0.0018 in ovarectomized animals.

h) Toxicokinetics

Toxicokinetics study was performed in Fischer 344 female rats (29 days old) to examine the disposition of 4-hydroxybenzoic acid 120 hr after i.p. (2.5 μ g, approx. 1 μ Ci) and dermal (5 μ g, 3.9 μ g/cm², approx. 2 μ Ci) administration (Hughes and Hall: 1997). Urinary excretion was the predominant means of elimination and occurred primarily within 24 hr after i.p. and dermal administration. The 120 hr cumulative excretion after i.p. administration was 86.5 % in urine and 3.4 % in faeces, and 10.2 % was detected in the carcasses of treated animals. The dermal absorption was very low (2 %). The major portion of the dose not absorbed dermally in 24 hr was washed from the skin. The 120 hr cumulative excretion after dermal administration was 1.9 % in urine and 0.04 % in faeces. 2 % and 0.28 % was detected in the treated skin and the carcasses of treated animals, respectively. In this study, the skin irritation did not occur because of very small amount application to skin.

i) Experience with human exposure

Occupational exposure to airborne epichlorohydrin (0.9-1.5 mg/m³), toluene (1.3-2.13 mg/m³), and diphenylolpropane, 4-hydroxybenzoic acid, N-glycidyl-m-aminobenzoic acid, and isophthalic acid (2-5 mg/m³) at the manufacture of epoxy resins induced contact and allergic dermatitis and sensitization to bacterial and chemical allergens. However, any further detailed information is not given. (Chernykh and Savchenko: 1988)

4.3 Initial Assessment for Human Health

Oral LD₅₀ of 4-hydroxy benzoic acid for rats is more than 2,000 mg/kg. This chemical is considered to be slightly irritating to skin and moderate to eyes, and a mild skin sensitizer. In an OECD combined repeat dose and reproductive/developmental toxicity study in rats at 40, 200 and 1,000 mg/kg/day, this chemical induced rale and rhinorrhea, indicative of imitation to respiratory tract irritation, and small fluctuation of blood chemistry with no changes of histopathological findings and organ weights. As these changes of blood chemistry are considered not to be adverse, NOAEL for systemic toxicity is 1,000 mg/kg/day. Reproductive toxicity was not observed (NOAEL = 1,000 mg/kg/day). This chemical is not genotoxic, based on negative results of bacterial mutation test and chromosomal aberration test *in vitro*. In vaginal cornification and uterotrophic assay of mice, this chemical showed estrogenic response *in vivo*.

Occupational exposure

4-Hydroxybenzoic acid is used in a closed system at industries. Although the occupational exposure route is expected as an inhalation in limited workers, there is no available data of the atmosphere concentration. Based on the predicted high concentration and the possibility of exposure period, the daily intake is calculated as 0.067 mg/kg/day as the worst cases. Occupational risk is presumably low because the margin of safety is 1.49 x 10⁴. Although this chemical is considered as an irritant for the skin and eyes, and a skin sensitizer, the risk is probably low because workers wear protective gloves and respiratory protective equipment (mask) during the operation.

Consumer exposure

No consumer exposure is expected because of use pattern.

Indirect exposure via environment

As for indirect exposure via environment, PEC_{local} of 9.70 x 10^{-4} mg/l from local exposure scenario was used for the estimation. The daily intakes through drinking water and fish are calculated as 3.23 x 10^{-5} mg/kg/day and 7.28 x 10^{-6} mg/kg/day, respectively. Since the margin of safety is very large, such as 3.09 x 10^{7} for drinking water and 1.37 x 10^{8} for fish, health risk is presumably low.

5. CONCLUSIONS AND RECOMMENDATIONS

5.1 Conclusions

4-Hydroxybenzoic acid is readily biodegradable (OECD 301C: 100 % after 28-d) and low bioaccumulative judging from a relative low Pow value (1.37 at 25 °C). Toxicity of this chemical seems relatively low to aquatic organisms because all toxicity data to test organisms belonging to three trophic levels are higher than 32 mg/l. PEC/PNEC ratio is less than 1 based on the local exposure scenario in the Sponsor country. It is currently considered of low potential risk for the environment and low priority for further work.

4-Hydroxybenzoic acid showed no systemic and reproductive toxicity in an OECD combined repeat dose and reproductive/developmental toxicity study. This chemical is not genotoxic and considered to be slightly irritating to skin and moderate to eyes, and a mild skin sensitizer. The margin of safety for occupational and indirect exposure is calculated as 1.49×10^4 and 3.09×10^7 or 1.37×10^8 (through drinking water or fish), respectively. Therefore, it is currently considered of low potential human risk and low priority for further work.

5.2 Recommendations

No recommendation

Appendix 1

Method for Prediction of Environmental Concentration of Pollutant in Surface Water

1. Predicted environmental concentration in the local environment (PEC_{local}) with effluent release into river

When decomposition, precipitation and vaporization of pollutant can be ignored, it is used that simplified equation by complete mixing model shown with equation (1) to calculate predicted environmental concentration in the local environment (PEC_{local}) as for release effluent into river.

$$PEC_{local} (mg/L) = Co Q + Cs Qs$$

$$Q + Qs$$
(1)

Where

Co: Concentration of pollutant in upper stream of release point (mg/L)

Cs: Concentration of pollutant in effluent (mg/L)

Q: Flow rate of river (m^3/day)

Qs: Flow rate of effluent released into river (m³/day)

At the equation (1), when Co can be considered as 0, dilution factor of pollutant in the river (R) can be shown with following equation.

$$R = C_S/C = (Q + Q_S) / Q_S$$
 (2)

As the worst case, it is used to employ a flow rate at dry season as flow rate of river (Q). When flow rate at dry season is indistinct, it is estimated using the following equation in Japan.

Flow rate at dry season = mean flow late
$$/ 2.5$$
 (3)

2. Predicted environmental concentration in the local environment (PEC_{local}) with effluent release into sea

For prediction of concentration of pollutant in the sea water with effluent, it is employed generally Joseph-Sendnersymbol 146 ¥f "Times New Roman" ¥s 11'}s equation (4). This equation is one of analytic solution led under the following conditions from diffusion equation.

- 1 It is adopted large area of sea or lake.
- The flow rate of effluent and concentration of pollutant in the effluent are constant, and distribution of concentration is able to regard as equilibrium state.
- 3 Effluent is distributed uniformly to vertical direction, and it spreads in a semicircle or segment to horizontal direction.
- Diffusion coefficient of pollutant at the sea is in proportion to distance from release point of effluent.
- 5 There is not any effect of tidal current.
- 6 Decomposition of pollutant can be ignored.

Where

C (x): Concentration of pollutant at distance x (m) from release point

Cs: Concentration of pollutant in effluent

C (r): Concentration of pollutant at distance r (m) from release point

Os: Flow rate of effluent (m³/day)

: Opening angle of seacoast (rad.)

d: Thickness of diffusion layer (m)

P: Diffusion velocity (m/day) (1.0 0.5 cm/sec)

When C(x) is 0 at r = and density stratification is ignored for simplification, Joseph-Sendnersymbol 146 \(\frac{1}{2}\)f "Times New Roman" \(\frac{1}{2}\)s equation (4) is simplified to equation (5)

Qs

$$C(x) = Cs (1 - exp (- ----))$$

 $d p x$ (5)

Because of Qs/d p x \leq 1 except vicinity of release point, dilution factor in distance x from release point R(x) can be shown with equation (6).

$$R(x) = C_S/C(x) = d_p x/Q_S$$
(6)

When it is employed following parameters in equation (6) as default, dilution factor R can be shown with equation (7).

P = 1 cm/sec (860 m/day)

= 3.14

d = 10 m

x = 1000 m

$$R = 2.7 \ 10^7 / Qs \tag{7}$$

Os: volume of effluent (m³/day)

4.2 ACUTE TOXICITY TO AQUATIC INVERTEBRATES

*A. Daphnia

Type of test: static []; semi-static [X]; flow-through []; other (e.g. field test) [

]; open-system [X]; closed-system []

Species: Daphnia Magna.

Exposure period: 48 h

Results: EC_{50} (48 h) = 135.7 mg/l Yes [X] No [] ? [] Method: OECD TG 202 Yes [X] No [] ? []

Test substance: As prescribed by 1.1 - 1.4, purity: > 95 %

Remarks: 20 daphnids (4 replicates of 5 organisms) were exposed to

nominal concentrations of 26, 42, 67, 107, 172 and 275 mg/l, and laboratory water control (M4-medium). The measured concentrations were within 95.0 to 99.7% of the nominal concentrations throughout the test period. No solubilizer was

used.

Reference: Environment Agency of Japan (1995)

*4.3 TOXICITY TO AQUATIC PLANTS, e.g. algae

Species: Selenastrum capricornutum ATCC 22662
Endpoint: Biomass [X]; Growth rate []; Other []

Exposure period: 72 h

Results: Biomass EC_{50} (72h) = 68.5 mg/l

(Endpoint) NOEC = 32 mg/l

Analytical monitoring: Yes [X] No []? [] Method: OECD TG 201 (1984)

open-system [X]; closed-system []

GLP: Yes [X] No [] ? []

Test substance: As prescribed by 1.1 - 1.4, purity: > 95 %

Remarks: Static test. The EC₅₀ value for growth rate (% inhibition) was

calculated based on 5 nominal concentrations (20, 32, 51, 82, 131 and 210 mg/l). No solubilizer was used. Measured concentrations were within 98.5 to 101.3 of the nominal concentrations after 3

days test period.

5.2 CORROSIVENESS/IRRITATION

5.2.1 SKIN IRRITATION/CORROSION

Species/strain: New Zealand white rabbits

Results: Highly corrosive []; Corrosive []; Highly irritating [];

Irritating []; Moderate irritating []; Slightly irritating [X]; Not

irritating []

Classification: (If possible, according to EC Directive 67/548/EEC)

Highly corrosive (causes severe burns)[]; Corrosive (causes

burns)[]; Irritating[]; Not irritating[]

Method: Other (according Code of Federal Regulation (CFR))

GLP: Yes [] No [] ? [X] Test substance: purity: unknown

Remarks: 4-Hydroxybenzoic acid (500 mg) was applied to the clipped skin

with occulusive dressing for 24 hours. Cutaneous reaction was evaluated approximately 24, 48 and 72 hours, and 8 days after the test beginning. Erythema and edema were observed but these changes were very weak. Erythema was reversible within 8 days

but edema was not.

Reference: Bayer Report: 1980a

5.2.2 EYE IRRITATION/CORROSION

Species/strain: New Zealand white rabbits

Results: Highly corrosive []; Highly irritating [];

Irritating []; Moderate irritating [X]; Slightly irritating []; Not

irritating []

Classification: (if possible, according to EC Directive 67/548/EEC)

Irritating []; Not irritating []; Risk of serious damage to eyes []

Method: Other (according Code of Federal Regulation (CFR))

GLP: Yes [] No [] ? [X] Test substance: purity: unknown

Remarks: 4-Hydroxybenzoic acid (100 µg) was applied to conjunctivae

under the right eyelid. The eye was closed for 1 second and not washed. As control, left eye remained. Eye reaction was evaluated approximately 24, 48, and 72 hours, and 8 days after

the test beginning.

Corneal opacity, conjunctival redness, and chemosis were observed. These signs of irritation were not reversible within 8

days.

Reference: Bayer Report: 1980b

5.3 SKIN SENSITISATION

(a) Type: Guinea pig maximization test

Species/strain: Guinea pigs/Dunkin Hartley strain

Results: Sensitizing [X]; Not sensitizing []; Ambiguous []

Classification: Sensitizing []; Not sensitizing []

Method: Other

GLP: Yes [] No [X] ? [] Test substance: purity: unknown

Remarks: 10 animals (4 animals in control group) were inducted

intradermally at 1.0 % and topically at 20 % six to eight days later. After 12-14 days, all animals were challenged at 20 %. Mild response was induced. The sensitization potential was 20 % (the percentage of animals exhibiting a reaction significantly

greater than control animals).

Reference: Scholes et al.: 1992

(b) Type: Local lymph node assay

Species/strain: Mice/CBA/Ca strain/female

Results: Sensitizing []; Not sensitizing [X]; Ambiguous []

Classification: Sensitizing []; Not sensitizing []

Method: Other

GLP: Yes [] No [X] ? [] Test substance: purity: unknown

Remarks: Four animals were inducted by daily topical application of 2.5 –

15.0 % for three consecutive days. Five days after the initiation of exposure, [3H] methyl thymidine was injected and the

labeling in lymph node cells was measured.

The ratio of labeling incorporation by test lymph node cells to that recorded for control lymph node cells, (T/C) ratio was 0.6 –

1.5 (more than 3.0 is positive).

Reference: Scholes et al.: 1992

*5.4 REPEATED DOSE TOXICITY

Species/strain: Rats/Crj: CD (SD)

Sex: Female []; Male/Female [X]; No data []

Route of Administration: Oral (by gavage) Exposure period: Male: 42 days

Female: From 14 days before mating to day 3 of lactation

Frequency of treatment: Daily Post exposure observation period:

Dose: 0, 40, 200, 1,000 mg/kg/day

Control group: Yes [X]; No []; No data []; 0.5 % CMC-Na

Concurrent no treatment]; Concurrent vehicle[X]; Historical[]

NOAEL: Male: 1,000 mg/kg/day, Female: 1,000 mg/kg/day

LOAEL: All animals survived at all treated groups. 4-Hydroxybenzoic

acid induced rale and temporary salivation (sometimes accompanied by rhinorrhea) at 1,000 mg/kg and slightly at 200 mg/kg. These changes were suggesting the irritation of this chemical to respiratory tract. There were no adverse effects on body weight change and food consumption. At necropsy, no histological and morphological changes were observed. In hematological and blood chemical findings of males, decrease in the percentage of lymphocytes and the blood glucose at 200 mg/kg or more groups and decrease in total protein and increase in A/G ratio, GPT and GOT at 1,000 mg/kg were observed. These changes were significant, but not considered adverse effects. Therefore, NOAEL for systemic toxicity was considered

to be 1,000 mg/kg/day.

Method: OECD Combined Repeat Dose and

Reproductive/Developmental Toxicity Screening Test

GLP: Yes [X] No [] ? []

Test substance: purity: 99.7 % Reference: MHW, Japan: 1997

5.10 OTHER RELEVANT INFORMATION

A. Specific toxicities

Type: Inhibitory effect on hepatic enzyme

Results: 4-Hydroxybenzoc acid competed with the substrate mevalonate

5-pyrophosphate, and inhibited mevalonate pyrophosphate decarboxylase. And this chemical also inhibited mevalonate

phosphate kinase.

Remarks: Male albino rats were killed and the liver were quickly removed,

chilled and homogenised in 0.25 M sucrose. The homogenate was centrifuged at 38,000 x g for 40 min and the resultant supernatant

was used as the source of enzyme.

As the substrate, (R)-[1-¹⁴C] mevalonate 5-phosphate and (R)-[1-

¹⁴C] mevalonate 5-pyrophosphate was used.

Reference: Shama Bhat & Ramasarma: 1979

Type: Estrogenic assay (vaginal cornification and uterotrophic assay)

Results: A dose-dependent response on vaginal cornification and

uterotrophic activity was observed in both immature intact and adult ovariectomized mice treated with 4-hydroxybenzoic acid. The relative uterotrophic potency of this chemical (500 $\mu g/100$ g) to estradiol (1 μg /100 g) was 0.0011 and 0.0018 in immature

and ovariectomized animals, respectively.

Remarks: Immature intact and adult ovariectomized female mice (CD1)

were treated subcutaneously daily for 3 days with vehicle (corn oil, 0.3 ml/100 g), estradiol (1 μg /100 g), and 4-hydroxybenzoic acid (0.5, 5, 50, and 500 $\mu g/100$ g). Four days after treatment,

estrogenic effect was analyzed.

Reference: Lemini et al.: 1997

B. Toxicodynamics, toxicokinetics

Type: Toxicokinetics

Results: Urinary excretion was the predominant means of elimination

and occurred primarily within 24 hr after dermal and i.p. administration. The 120 hr cumulative excretion after i.p. administration was 86.5 % in urine and 3.4 % in faeces, and 10.2 % was detected in the carcasses of treated animals. The dermal absorption was very low (2 %). The major portion of the dose not absorbed dermally in 24 hr was washed from the skin. The 120 hr cumulative excretion after dermal administration was 1.9 % in urine and 0.04 % in faeces. 2 % and 0.28 % was detected in the treated skin and the carcasses of treated animals,

respectively.

Remarks: Female Fischer 344 rats (29 days old) were dosed with 4-

hydroxybenzoic acid by i.p. (2.5 μ g, approx. 1 μ Ci) and dermal (5 μ g, 3.9 μ g/cm², approx. 2 μ Ci) route. In the dermally treated animals, treated area was washed 24 hr after dosing. Urine and faces were collected at 4, 8, 12, 24, 48, 72, 96 and 120 hr, weighted after collection and stored at –70 until analysed. The animals were killed by CO₂ asphyxiation at 120 hr after treatment. A sample of treated and untreated skin was removed from the dermally treated animals. The skin and samples of the whole-animal homogenate were weighted, combusted and

analysed for radioactivity.

References: Hughes & Hall: 1997

* 5.11 EXPERIENCE WITH HUMAN EXPOSURE

Results: Occupational exposure to airborne epichlorohydrin, 0.9-1.5

mg/m³; toluene, 1.3-2.13 mg/m³; and diphenylolpropane, p-hydroxybenzoic acid, N-glycidyl-m-aminobenzoic acid, and isophthalic acid, 2-5 mg/m³ at the manufacture of epoxy resins induced contact and allergic dermatitis and sensitization to

bacterial and chemical allergens.
